

Gestalt's Laws of UI

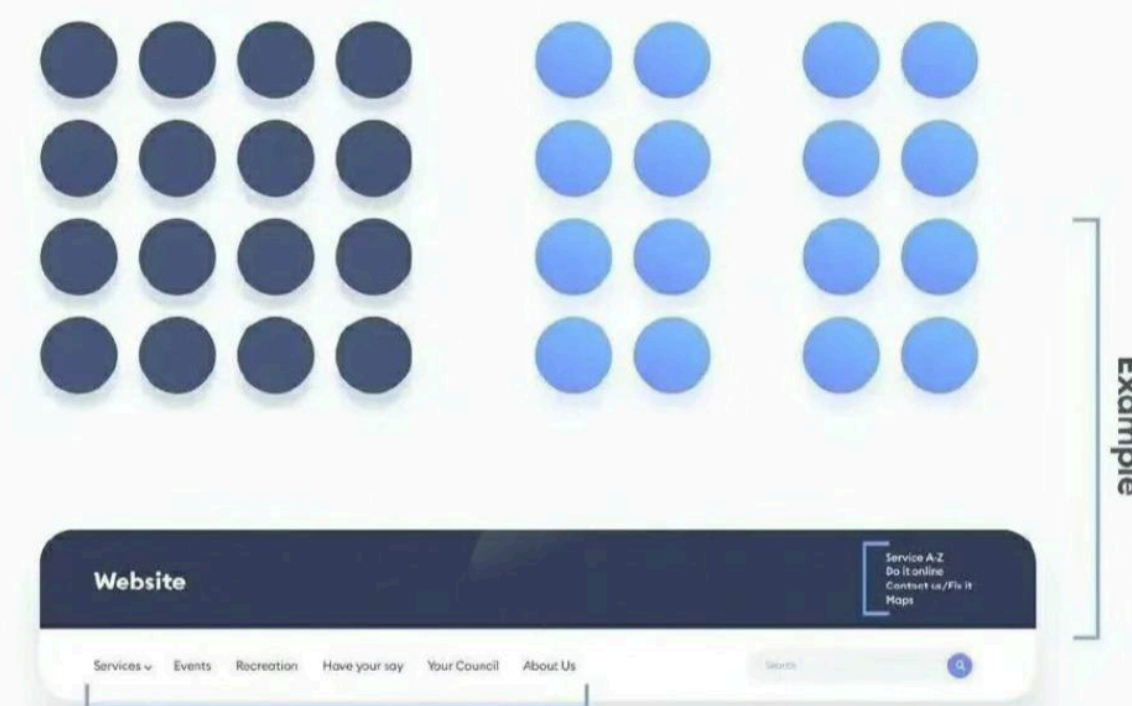

Law of Closure

This law states that human mind fills in the spaces and creates a complete image when you see an image with missing parts.

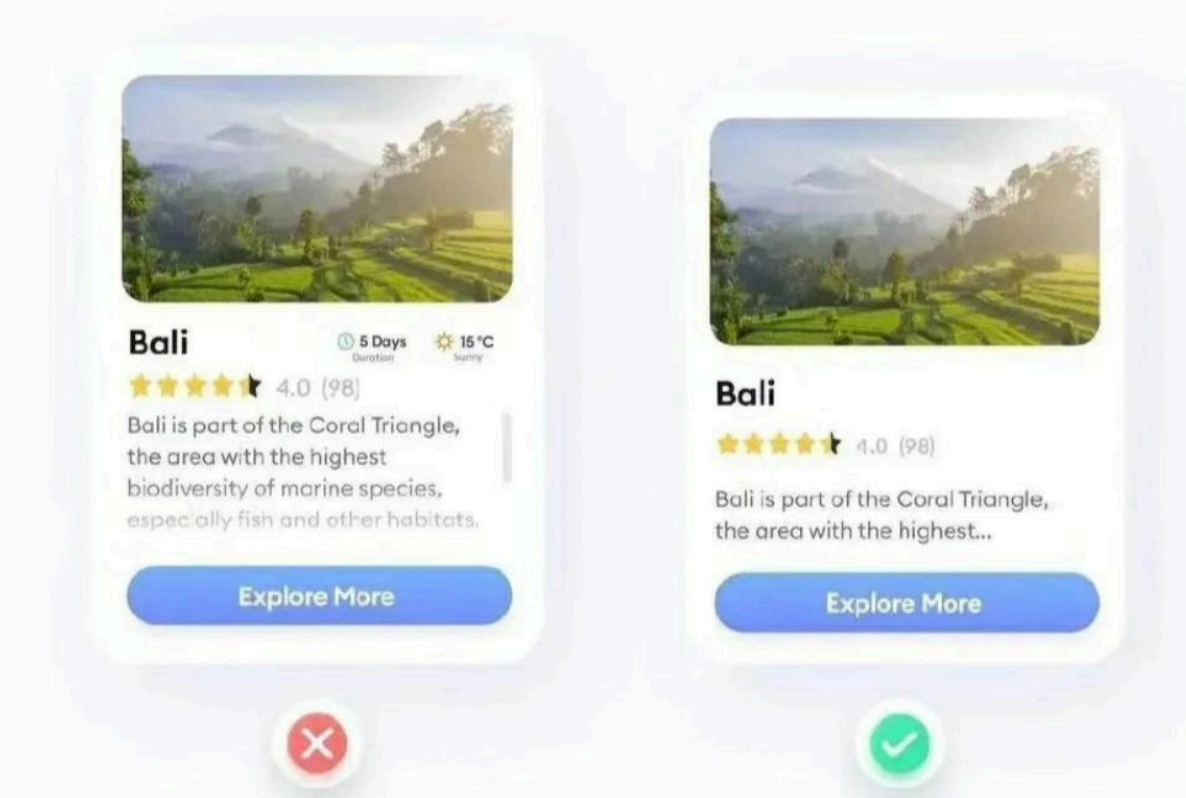

Law of Proximity

The principle of proximity states that things that are close together appear to be more related than things that are spaced farther apart.

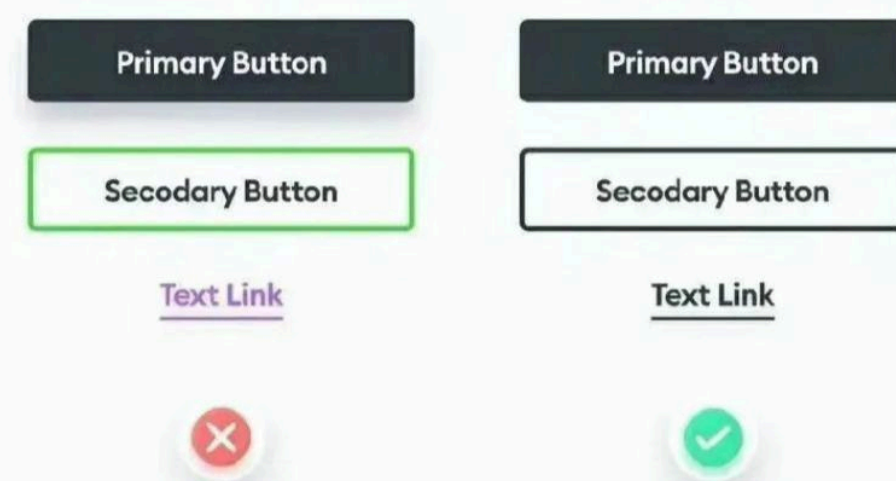

Law of Simplicity

The Law of Simplicity indicates that elements are always perceived in the most easiest way possible.

Law of Similarity

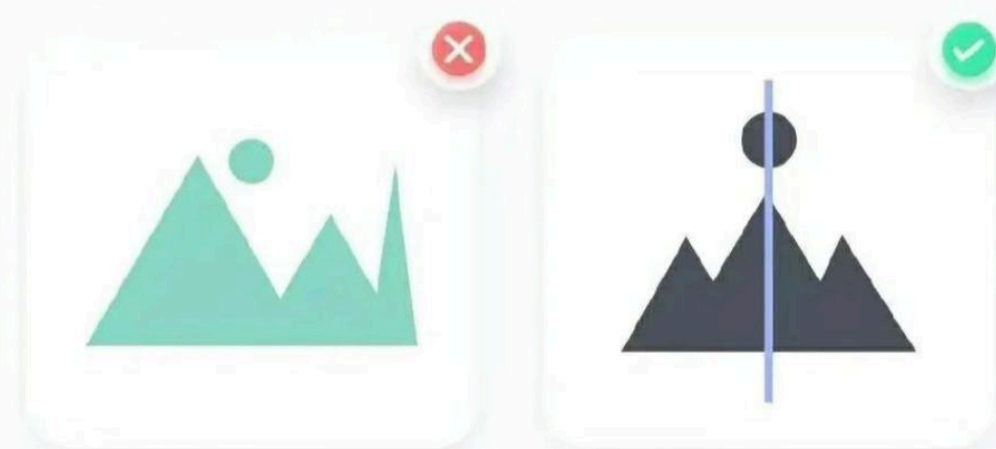

This law states that elements that are similar to each other tend to be perceived as a unified group. Similarity can refer to any number of features, including color, orientation, size, or indeed motion.

Order and Symmetry

The Gestalt principle of symmetry is when people perceive symmetrical elements as part of a unified group.

It should come as no surprise that people tend to look for order in objects, and symmetry is one means of doing that.

Law of Continuity

The principle of continuity states that elements that are arranged on a line or curve are perceived to be more related than elements not on the line or curve.

Common Region

Objects that share an area with a boundary will be visually grouped together.
